Statistics:

Statistics is the science of collecting, organizing and analysing data, There are two types of statistics

1) **Descriptive stats**
2) **Inferential Stats**

Descriptive stats:

It consists of **organizing and summarising** the data**.** They provide simple summaries of the sample and the measures. Together with simple **numerical** and **graphical analysis.**

Inferential Stats:

it consists of making some conclusions using some experiments based on collected data.

With inferential statistics, you are trying to reach conclusions that extend beyond the immediate data alone. For instance, we use inferential statistics to try to infer from the sample data what the population might think.
