Performance Metrix for classification. The same is also called

Confusion matrix

1) Accuracy
2) Precision
3) Recall
4) F-Beta Square

Confusion matrix :

The confusion matrix can be explained by studying the graph below.

Precision

We focus on Precision when It is important to evaluate and **minimize "false positives"**, especially in sensitive domains where false negatives are less of a concern compared to false positives.

High Precision means that the model is effective where we want to minimize **"false positives"**.
