“If else” condition in python

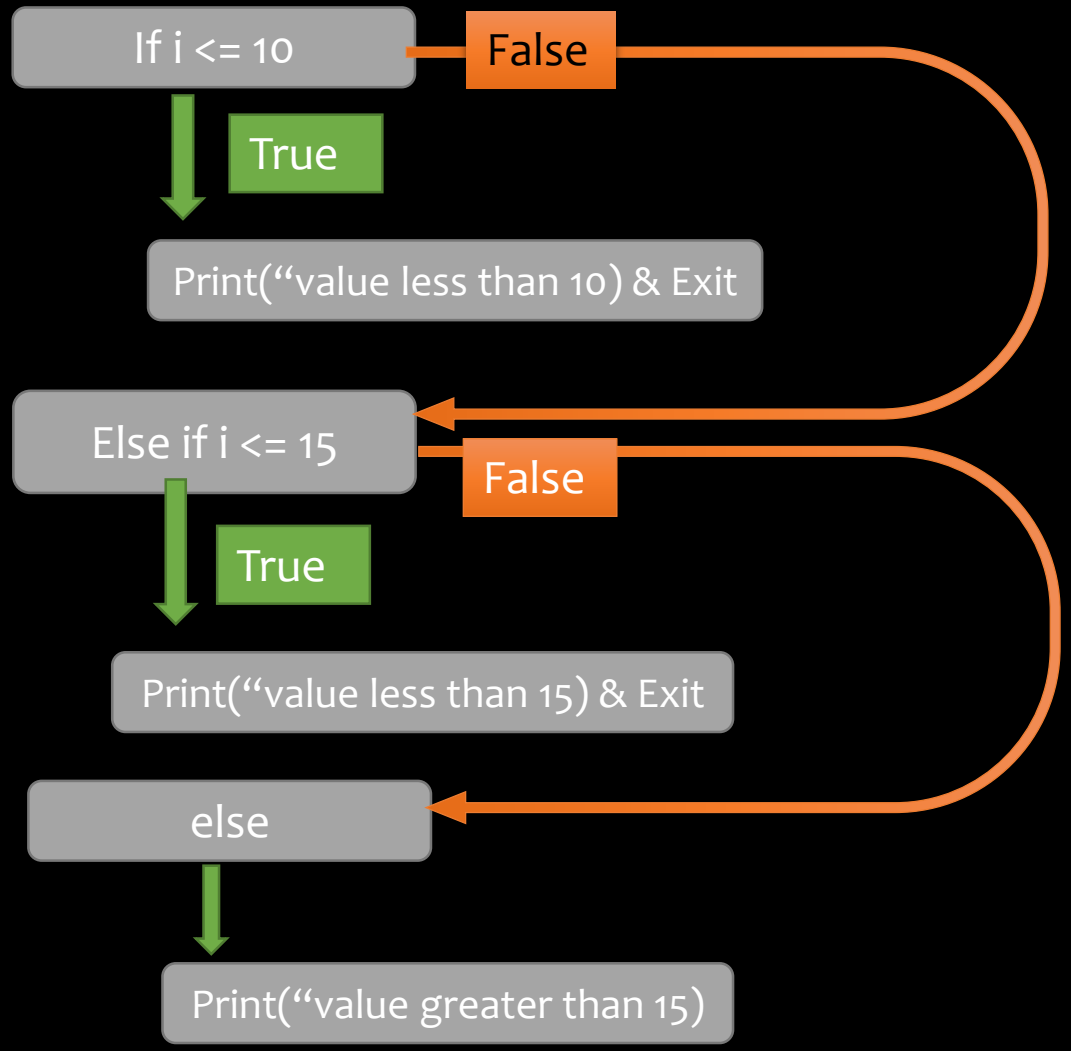

The "if" condition is a fundamental control structure in programming that allows you to execute certain blocks of code based on whether a specific condition is true or false. It enables you to control the flow of your program by making decisions dynamically during runtime.

If condition is true it enters the block.

If condition is false it jump to next statement.

i=13

If i <= 10
False
True
Print("value less than 10) & Exit
Else if i <= 15
False
True
Print("value less than 15) & Exit
else
Print("value greater than 15)

While Loop

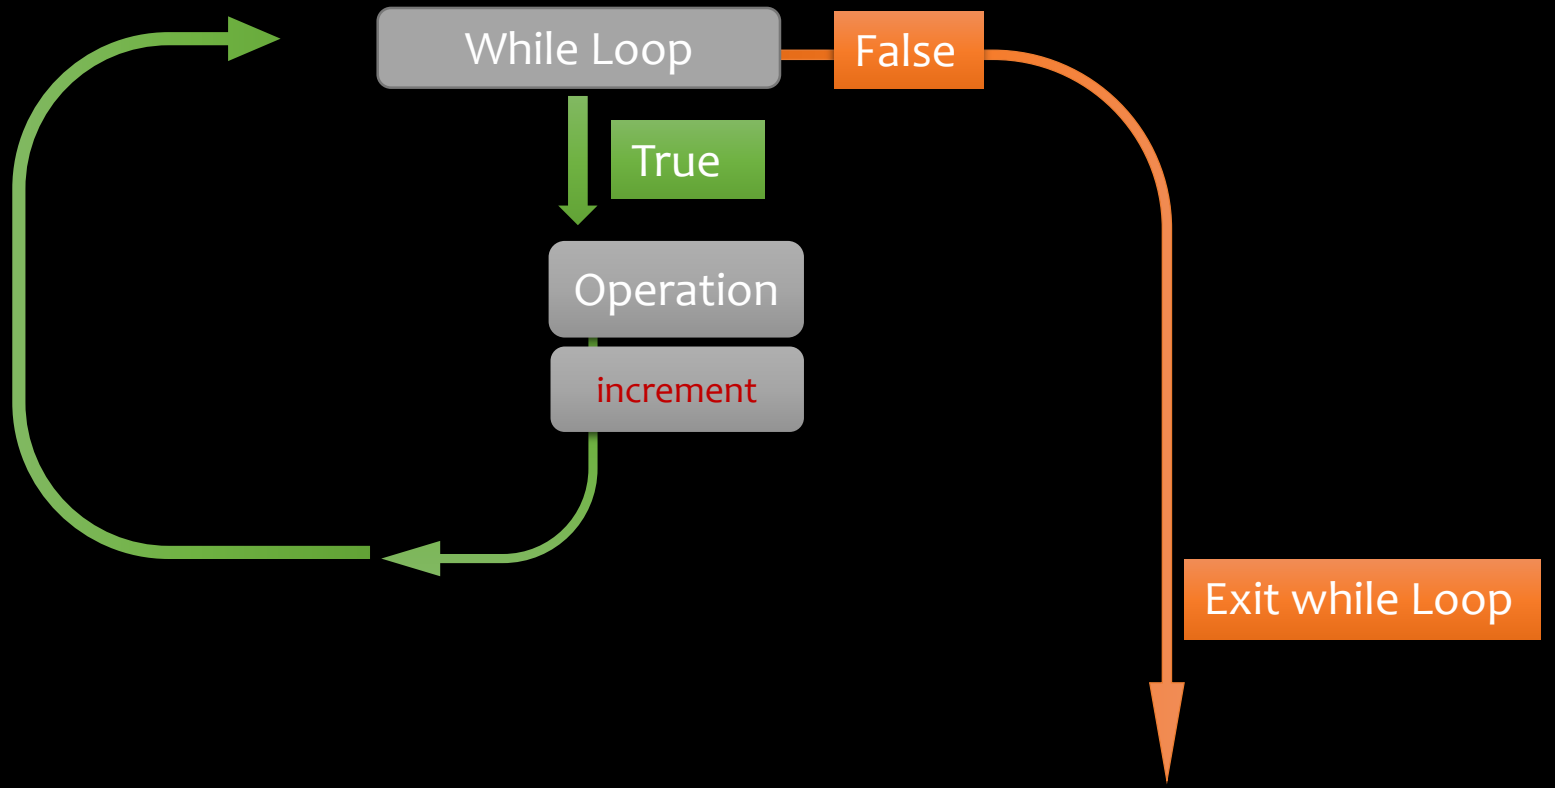

A **while loop** in Python is used to repeatedly execute a block of code.

As long as a specified condition is true It keeps running.

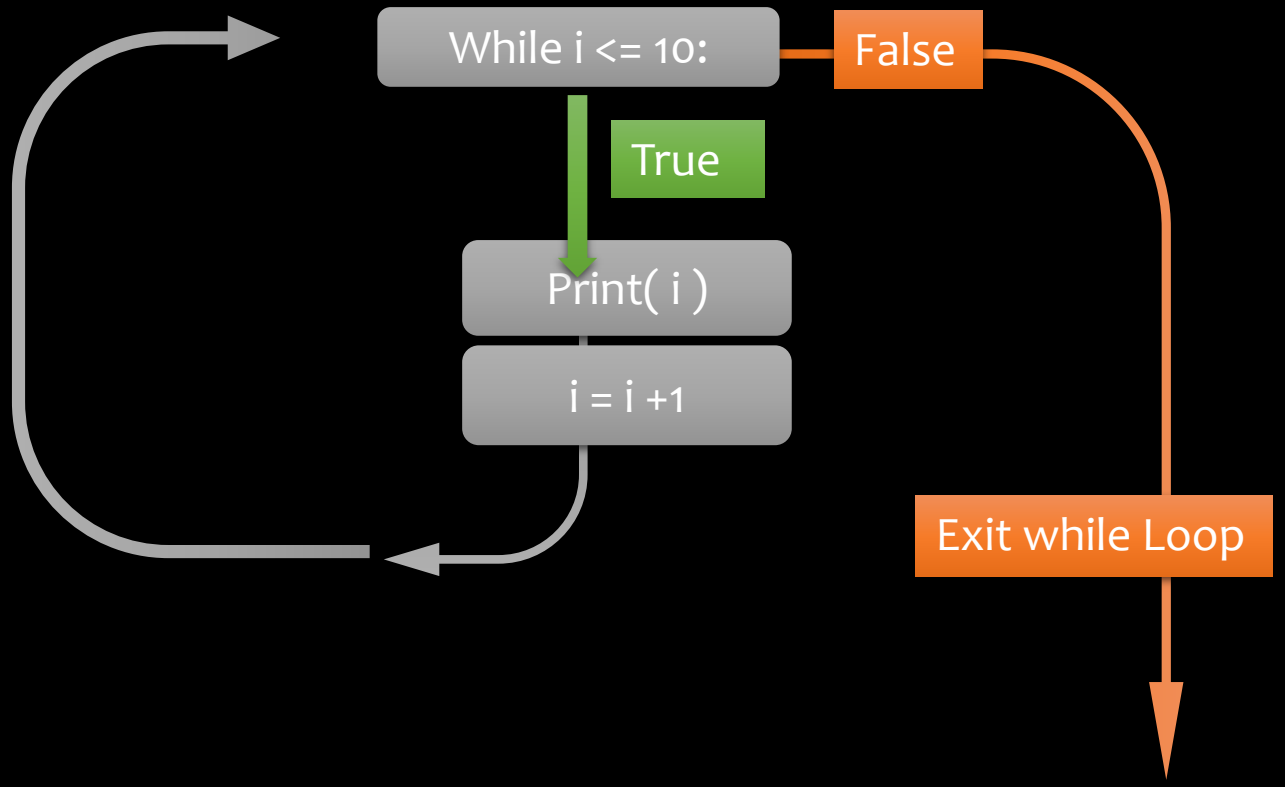

It enters the block when the condition is **true** and **stops when the condition becomes false.**

A while loop typically uses:

- **Comparison operators** – to compare values in the condition (such as ==, !=, <, >, <=, >=)
- **Assignment operators** – to update (change) the value of a variable (such as =, +=, -=, etc.)

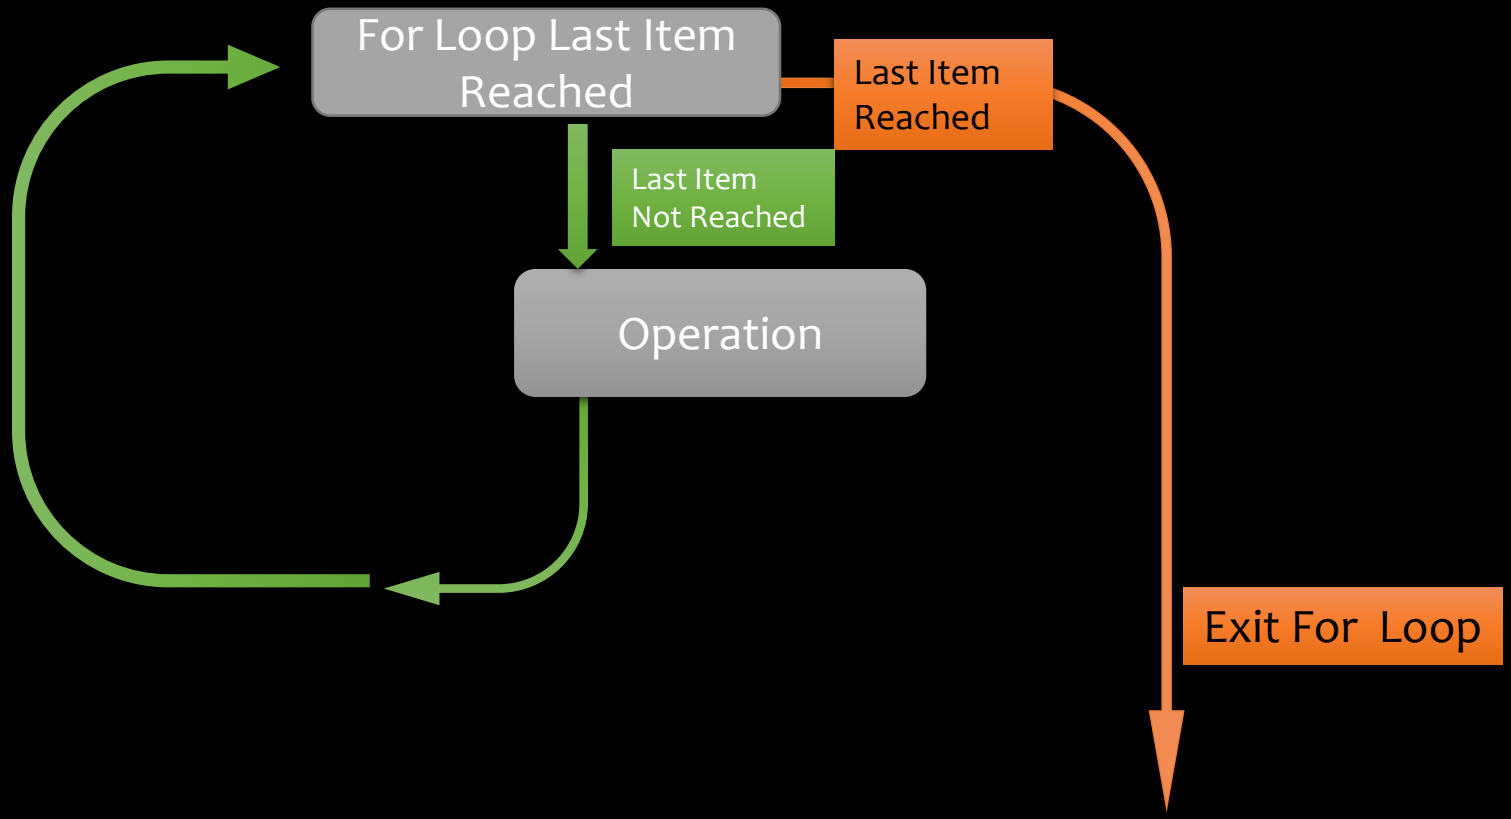

i = 0

9
10

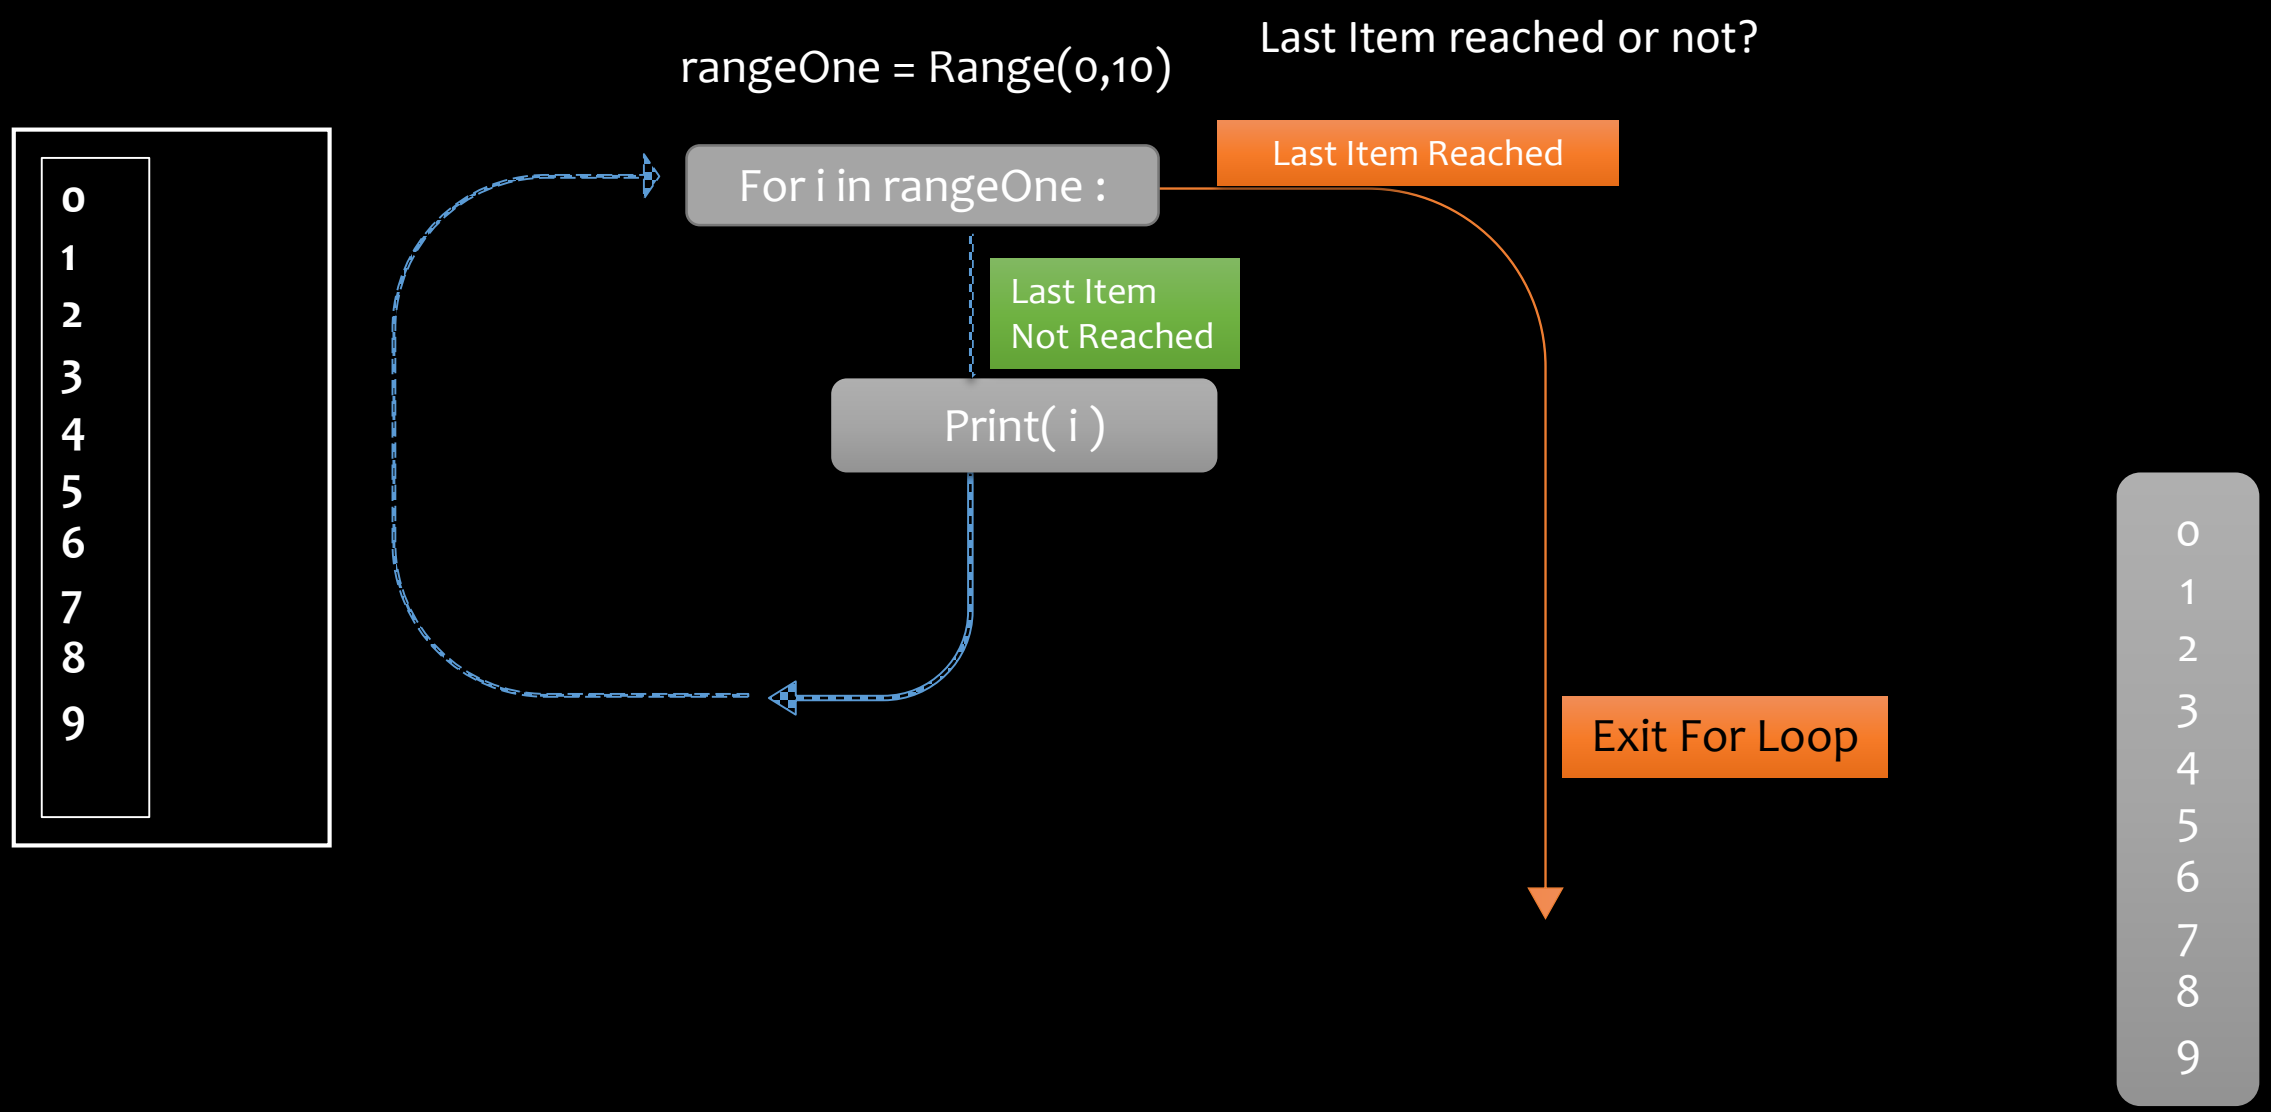

i

For Loop
•Takes the **first item** from the sequence
•Executes the block
•Takes the **next item**
•Executes the block again
•Continues until **no items are left**
When there are **no more items,** the loop automatically stops.

Last Item reached or not?
ListOne = [‘a’,’b’, ‘c’]

rangeOne = Range(0,10)
Last Item reached or not?
For i in rangeOne :
Last Item Reached
Last Item
Not Reached
Print(i)
Exit For Loop
