Tuples:

Tuples in Python are ordered collections of elements, similar to lists, but with the key difference that tuples are **immutable**. This means that once a tuple is created, its elements cannot be changed, added, or removed. Tuples are defined by enclosing comma-separated elements within parentheses ().

		Tuple
Creation	Simple Method	thistple = ("apple", "banana", "cherry", "orange")
	by USING Constructor	thistple = tuple(("apple", "banana", "cherry", "orange"))

Access / Slicing Items	print(thistple[1]) ans= [apple]
	print(thistple[-1]) ans= [mango]
	print(thistple[2:5]) ans=[cherry, orange, kiwi]
	print(thistple[:4]) ans=[apple, banana, cherry, orange]
	print(thistple[2:]) [cherry, orange, kiwi, melon, mango]
	print(thistple[-4:-1]) [orange, kiwi, melon]

Loop Through	#To print all value:-
	for x in thistple: print(x)
	apple banana cherry orange kiwi melon mango

Length	len(abc)

Check if Item Exists	if "apple" in thistple: print("Yes, apple is in the fruits list")

Changing the item	Since Tuple is immutable, if you need to add or change any item, then 1st convert Tuple into a list and then you can change or add the item in tuple

Adding an Item	To add an item at the Last index	Convert Tuple to List then you can add An Item

	To add an item at the specified index	Convert Tuple to List then you can add An Item at specific index
Remove		Tupple is Immutable, Hence you cannot remove items in a tuple.
Clear	To empty the list:	Tuples cannot be emptied, since they are immutable.
Delete	To delete the Data Completely	del abc
Copy		Tuples cannot be copied since they are immutable.

Join		Tupple Example abc = ("a", "b" , "c") xyz = (1, 2, 3)
	by + operator	ddd = abc + xyz print(ddd)

Number of elements in dataset	xyz.count(2)
	1
Index of the first element with the specified value	index()
Reverses the order	---
Sorts the list	---
