Iterable and Iterator:

In programming, particularly in languages like Python, the concepts of iterables and iterators are fundamental for working with collections of data. Here's a detailed explanation of each:

Iterable:

An iterable is any object that can be looped over or iterated upon. Examples

- ***lists***
- ***tuples***
- ***strings***
- ***dictionaries***
- ***sets etc.***

Iterables must implement the ***__iter__()*** *method, which returns an iterator.*
